City Bike Pilot Guide

A fictional, open sample document for RAG StepLab

1 · Pilot overview

The Harbor City Bike pilot runs from April 1 to September 30, 2025. Its goal is to measure access to short-distance transport in three neighborhoods. The pilot is entirely fictional; this document does not describe a real municipal policy.

The first phase has 24 stations and 180 bikes. Stations are distributed across Central, Harbor, and University neighborhoods. Thirty bikes have electric assist. The program owner is the Mobility Innovation Team, and Derya Aksoy leads operations.

The pilot targets at least 12,000 rides per month and an available bike at the station for at least 85% of users. These numbers are targets, not achieved results.

2 · Use and pricing

Registration is completed in the mobile app with email verification. Riders unlock a bike by scanning a station QR code. The first 15 minutes of every ride are free; each additional 15 minutes costs 10 TRY. The daily charge is capped at 80 TRY.

Electric-assist bikes use the same time-based price. They can be picked up only at Central and University stations, though they may be returned at Harbor.

During the pilot, refund requests go through the Support menu in the app. If a station has no bikes, riders can choose a nearby station on the map; there is no reservation feature.

3 · Operations and data

Field staff check stations daily at 06:00 and 18:00. A broken bike is marked unavailable in the app and inspected within 48 hours. A reported safety risk takes the bike out of service immediately.

Ride records include start and end station, duration, bike ID, and charge amount. Pilot analysis uses de-identified ride data. Raw ride records are deleted after 90 days; aggregate reports are retained until the pilot ends.

A weekly operations report is prepared every Monday. It shows ride count, available-bike rate, and open maintenance issues. Personal ride histories are not included in the report.

4 · Evaluation and limits

The pilot is evaluated on October 15, 2025. The team reviews the monthly ride target and the 85% availability target together. If the targets are missed, station placement and maintenance frequency are reconsidered; a permanent rollout is not automatic.

This four-page document is a RAG learning example. Answers should rely on explicit information from the relevant pages. The system should not invent an event or result that the text does not contain. In particular, targets must not be confused with outcomes.

Example questions: When and where does the pilot run? What are the ride price and daily cap? How are broken bikes handled? Which two targets measure success?
